

AZ-104 Practice Hub

Project Documentation

Maintainer: Manav Jagtap

Purpose: A static, browser-based practice platform for Microsoft Azure Administrator (AZ-104) preparation using the supplied three-question-bank source set.

1. Project Overview

The project organizes 1,273 source question records into five AZ-104-oriented domains and provides timed topic-wise and overall mock tests. Each mock selects up to 50 random questions and awards one mark per question.

2. Question Bank

Domain	Records
Manage identities and governance in Azure	284
Deploy and manage Azure compute resources	298
Implement and manage storage in Azure	194
Configure and manage virtual networks for Azure administrators	406
Monitor and back up Azure resources	91
Total	1273

The source wording and source answers are preserved unless a verified correction is explicitly tagged. Records that depend on PDF exhibits, diagrams, screenshots, tables, or other layout may require the original source PDF when the extracted text is incomplete.

3. Main Features

Dashboard with domain counts; random 50-question topic mocks; random overall mock; 60-minute timer; single-select and multi-select answers; previous/next navigation; question palette; mark-for-review; score and percentage; answer review; and a complete searchable-by-topic question-bank browser.

4. Technical Design

The application is intentionally static: HTML provides the entry page, CSS provides the responsive dark interface, JavaScript handles mock-test state and scoring, and the question bank is stored as JSON plus a JavaScript wrapper for direct local-file compatibility. No server, database, framework, API key, or build step is required.

5. GitHub Pages Deployment

Upload the repository files to the root of a GitHub repository. In Settings > Pages, choose Deploy from a branch, select main and /(root), then save. The generated Pages URL can be added to a resume, LinkedIn Featured section, or portfolio.

6. Testing Checklist

Verify that the dashboard reports 1,273 records; each domain count matches the source manifest; a topic mock contains 50 records when the domain has at least 50; the overall mock contains 50 records; timer countdown works; single and multi-select answers persist during navigation; review marking is visible; submission produces a score; answer review displays source answers; and the complete bank opens without JavaScript errors.

7. Attribution and Disclaimer

This is an independent educational practice project. It is not affiliated with or endorsed by Microsoft. Microsoft Azure and AZ-104 are trademarks of Microsoft Corporation. The MIT license in the repository covers the original website code, not third-party question-bank content, source PDFs, trademarks, or external diagrams/screenshots.

8. Future Improvements

Useful next steps include attaching source exhibits to visual questions, completing an official-documentation-based answer audit, adding local progress history, weak-topic analytics, configurable mock length, and a dedicated verified-corrections view.
